Named method and supported scope

Join origin explanations to exact transaction references. Sum signed six-place decimals with integer arithmetic separately for each transaction currency. Report differences, mixed currencies, duplicate references, missing origins and unsourced amounts. Preserve complete explanations and original evidence links.

No currency conversion, document extraction or lawfulness determination. Duplicate explanations and currency mismatch prevent a complete reconciliation rather than silently excluding money.

Original evidence bytes, annotations and customer rules remain in this browser unless explicitly approved for paid cloud saving. Customer verification and approval are declarations. Mechanical results do not authenticate source facts, decide legal applicability, clear screening hits, authorize transactions, classify exports, file reports or establish total wealth.

Only the supplied population is evaluated. Source annotations do not prove completeness, authenticity, reviewer authority or external screening. Missing and conflicting evidence remains visible.

Every accepted finding and original source reference is retained. Supplied text is not silently shortened. Original files are copied only into a local full backup or an explicitly approved artifact operation.

Recovery and original attachment boundary

The complete local ZIP includes every original file listed in the retained manifest. A structured JSON or cloud record alone preserves the descriptor and annotation, not the original file bytes. Attach matching bytes before producing a complete original-attachment pack.

Customer recovery restores neither source authentication, approval authority nor paid export access. Payment ownership is checked before each commercial export.
