Named method and supported scope

Join exact change IDs. Check changed version, request chronology, passed exact-version tests, source-linked prior approval, deployment sequence and rollback plan. Preserve failed, unrun and orphan records with every approval and deployment outcome.

Customer declarations do not prove a deployment occurred or a control operates. Tests must be complete and applicable; this tool does not run them or deploy software.

All original evidence, customer rules and factual verification are customer declarations. File hashes establish retained byte identity only.

The tool does not perform live screening, authenticate identities, decide legal applicability, approve transactions, file reports or certify effective controls.

Prepared results preserve complete accepted records. Recovery does not restore payment, source authentication or fresh approval authority.

Recovery and original attachment boundary

The complete local ZIP includes every original file listed in the retained manifest. A structured JSON or cloud record alone preserves the descriptor and annotation, not the original file bytes. Attach matching bytes before producing a complete original-attachment pack.

Customer recovery restores neither source authentication, approval authority nor paid export access. Payment ownership is checked before each commercial export.
