Named method and supported scope

Match exact policy and recipient identity/version, check event dates and originals, and flag outdated, duplicate or conflicting acknowledgment/decline assertions. Preserve event provenance and customer audit references.

No authenticated recipient event, electronic signature, delivery, participation or consent is generated. Up to 100 records per table.

All original evidence, approved rules, recipient events and factual verification remain customer declarations. File hashes establish retained byte identity only.

The tool does not decide credibility, legal applicability, publication, competence, participation, signature, delivery, regulator acceptance or submission.

Prepared results preserve complete accepted records. Recovery never creates payment, source authentication, fresh consent or approval authority.

Recovery and original attachment boundary

The complete local ZIP includes every original file listed in the retained manifest. A structured JSON or cloud record alone preserves the descriptor and annotation, not the original file bytes. Attach matching bytes before producing a complete original-attachment pack.

Customer recovery restores neither source authentication, approval authority nor paid export access. Payment ownership is checked before each commercial export.
